Partech have a range of instruments and analysers that are available for short term hire. This provides a cost effective way of sourcing monitoring equipment for use during construction work, site commissioning or as a tool for investigation of site performance.

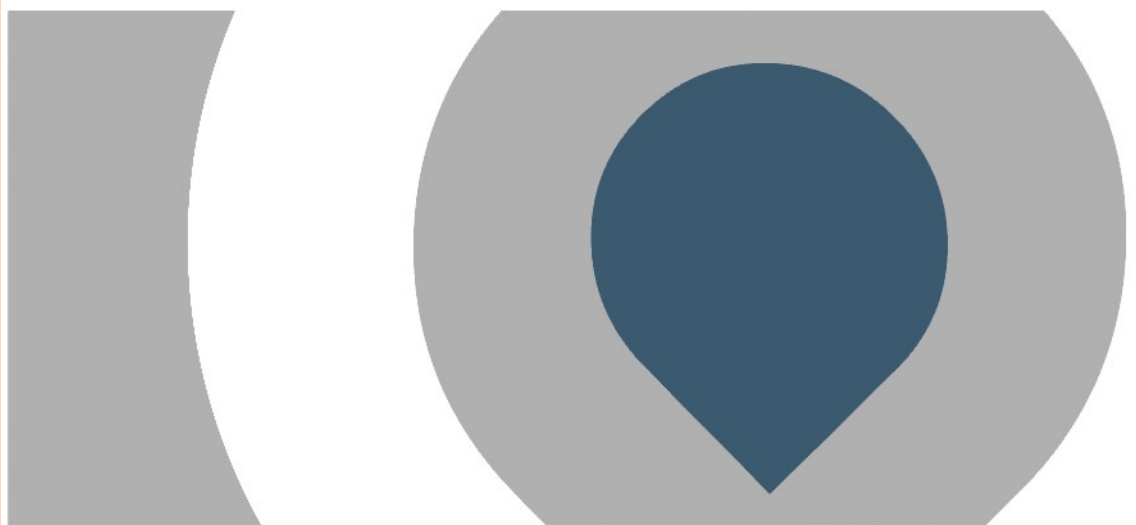

Available parameters include Dissolved Oxygen, Suspended Solids, Turbidity, Ammonia, Ortho-Phosphate and Organic Pollution.

The package based on the MicroMac 1000 analyser is normally offered as a package including delivery to site, deployment, commissioning and removal at the end of the hire period. We also provide all reagents and consumables for the duration of the hire and a report on the data recorded. The data can be downloaded by the user during the hire period, be integrated into the site telemetry system or be delivered by email or text to a nominated person.

These packages provide live data on the various measurements we offer including Dissolved Oxygen, Turbidity, Suspended Solids, Ammonia and/or Phosphate rather than waiting for delayed laboratory results or for an operator to be on site.

As with all Partech site services the package offered will be tailored to meet your needs.
